# CMV – CUSTOM MADE VACCINES

## IMPROVING HEALTH, REDUCING ANTIBIOTIC TREATMENTS

Vaccination is an excellent tool for the prevention of infectious diseases of livestock. Custom made vaccines enable animals to form an effective immune protection, where other preventive strategies like licensed vaccines are absent for a specific pathogen, pathogen strain or serotype. Custom made vaccines will help reducing antibiotic treatments. Custom made vaccines stimulate animals to form an effective immune protection. Flock

conditions may change constantly because a number of pathogens are able to mutate and change their properties, thereby quickly escaping the prophylactic scope of existing vaccines, and new strains or serotypes enter a flock. Custom made vaccine concepts offer the possibility to quickly react to these changes by using most actual isolates from the target farm starting with the next batch.

## PRODUCTION PROCESS

1

Viral and bacterial pathogens weaken the animal.

3

Production of a flock-specific vaccine.

5

After application the animal forms antibodies against the pathogen.

2

Sampling and identification of the pathogen.

4

Application of flock-specific vaccine.

6

Vaccine reduces morbidity and mortality from field infection.
